

Assignment & Submission Management System

A role-based school/college application for evaluating understanding of requirements, system design, API development, frontend implementation, and testing.

Project Type	Full-stack web application
Submission Deadline	14 August, 2026

Please read the requirements carefully and make reasonable assumptions where the requirements are not explicitly defined. Document those assumptions in the README.

1. Project Brief

Build a role-based Assignment & Submission Management System for a school or college. The system should allow teachers to create assignments for specific classes or courses, students to view and submit assignments, and teachers to review submissions and provide marks and feedback.

2. User Roles and Responsibilities

Admin	Teacher	Student
• Manage users. • Manage classes/courses and subjects. • Assign teachers to subjects/classes. • View all assignments and submissions. • Manage application-level settings where necessary.	• Create, update, and delete assignments. • Assign an assignment to a specific class/course and subject. • Define the title, description, deadline, and maximum marks. • Publish an assignment or keep it as a draft. • View student submissions. • Assign marks and provide feedback. • Change the submission status when necessary.	• View assignments assigned to their class/course. • View assignment details and deadline. • Submit an answer. • Update a submission before the deadline, if allowed. • View submission status, marks and teacher feedback.

Applicants may use a different but suitable design. Any important design decisions should be explained in the README.

3. Technical Requirements

Use the following technologies for the project:

Frontend	Next.js, React, TypeScript, responsive UI, form validation and API integration
Backend	ASP.NET Core Web API, C#, RESTful API, validation, error handling, logging and Swagger/OpenAPI
Database	PostgreSQL or MongoDB. Implement the required relationships, or explain the chosen data model.
Authentication	Login, JWT-based authentication, and role-based authorization
Testing	Unit tests covering important business rules, authorization, and submission workflows

4. Submission Guidelines

After completing the project, please submit the following:

Git repository link

Submit a GitHub or GitLab repository link containing the complete source code.

Complete project code

Include the frontend, backend/API, database files, and unit tests in the repository.

Database files

Include migration files, seed/sample data, and a database script or backup file, if applicable. The evaluator should be able to set up the database without manually creating tables or collections.

README.md

Include a short project overview, main features, technology stack, project structure, setup instructions, database setup instructions, instructions for running the frontend and backend, instructions for running the tests, assumptions, and known limitations.

Demo credentials

Provide working login credentials for the Admin, Teacher, and Student roles.

Environment configuration

Do not upload real passwords, API keys, or other sensitive information. Include an `.env.example` file showing the required environment variables.

Easy local setup

Provide clear and complete setup instructions in the README so the project can be run locally.

Admin	Email: _____	Password: _____
Teacher	Email: _____	Password: _____
Student	Email: _____	Password: _____

Optional additions

A live project URL, API/Swagger URL, Docker configuration, pagination, advanced filtering, notifications, or other additional features may be included, but they are not mandatory.

5. Final Checklist

Before submitting, please confirm the following:

- The repository link is accessible.
- Frontend and backend are both included.
- The database can be created using the provided files or instructions.
- Demo accounts for all three roles are available.
- The README explains how to run the project and its tests.
- Role-based access is enforced by the backend API.
- Important business rules are implemented and tested.
- No real secrets or credentials are committed to the repository.

6. Project Submission

After completing the project, please submit it through the following link:

<https://q-rp.com/c/4Cls>

If you face any issues while submitting your project, please contact us at hrd@onnorokom.com.

Thank you, and best of luck!
